

017 - CONSTANTS IN C

A constant is a value or variable that can't be changed in the program, for example: 10, 20, 'a', 3.4, "c programming" etc.

There are two ways to define constant in C programming.

1) The `const` keyword is used to define constant in C programming.

```
const constant_name = value;
```

2. The `#define` preprocessor is also used to define constant.

```
#define CONSTANT_VALUE VALUE
```
